                                                                                                                                                                                                                                                                                                                                 The present sequence is a human intracellular regulatory molecule, The KWC02, an interferon response factor (IRF) homologue, is a transcription factor. The polynucleotides encoding intracellular regulatory molecules are useful for regulating cell division and proliferation of various cell types, including tumour cells. Specifically, they are also useful for treating cancer, infections, wounds, developmental abnormalities or metabolic problems

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises determining the expression level of a marker gene in a biological sample from a subject, comparing the expression level determined with the expression level of the marker gene in a biological sample from a subject, and judging whether the subject has bronchial asthma or chronic obstructive pulmonary disease. The marker gene comprises: (a) a group of genes (S1) whose expression levels increase when respiratory epithelial cells are stimulated with interleukin-13, or (b) a group of genes (S2) whose expression levels decrease when respiratory epithelial cells are stimulated with interleukin-13, Also described: (1) a reagent (1) for testing for bronchial asthma or chronic obstructive pulmonary disease; (2) a kit for screening for a candidate compound for a therapeutic agent to treat bronchial asthma or chronic obstructive pulmonary disease; (4) an inducer that induces bronchial asthma in a mouse; (5) a marker gene or an animal model for bronchial asthma or chronic obstructive pulmonary disease; (6) a therapeutic agent for bronchial of asthma or chronic obstructive pulmonary disease; (6) a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease, (6) a therapeutic agent for bronchial of the gene through an RNAi effect or an antibody recognising condition of the marker gene, and subject or an antibody recognising condition of the marker gene or an antisense nucleic acid corresponding to a portion of the marker gene immobilised to assay a marker gene. (1) has respiratory disease, and antisathmatic activities, and can be used in gene therapeutic area on which a probe has been immobilised to assay and be used in gene therapeutic areas in general or an antisathmatic activities, and be used in gene therapeutic and antisathmatic activities, and be used in gene therapeutic and antisathmatic activities, and enterpression of the gene therapeutic and antisathmatic activit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  is useful for testing for or screening for a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease. The present sequence is used in the exemplification of the present invention
                                                                                                                                                                                                                                                          bronchial asthma; chronic obstructive pulmonary disease;

The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises determining the expression level of a marker gene in a biological sample from a subject, comparing the expression level determined with the expression level determined with the expression level as pronchial sample from a healthy subject, and judging whether the subject has bronchial asthma or chronic obstructive pulmonary disease. The marker gene comprises: (a) a group of genes (S1) whose expression levels increase when respiratory epithelial cells are stimulated with interleukin-13; or (b) a group of genes (S2) whose expression levels descrease when respiratory epithelial cells are trimulated with interleukin-13. Also described: (1) a reagent (1) for testing for bronchial asthma or chronic obstructive pulmonary disease; (2) a kit for screening for a candidate compound for a therapeutic agent to treat bronchial asthma or chronic obstructive pulmonary disease; (3) an animal model for bronchial asthma in a mouse; (5) a mathod for producing an animal model for bronchial asthma in a mouse; (5) a pherior in a mulmonary disease; (4) an inducer that induces bronchial asthma in chronic obstructive pulmonary disease; (5) a pherior in a mouse of thouse the producing an animal model for bronchial asthma or chronic obstructive pulmonary disease; (5) a pherior in a mouse; (5) a pherior in a mouse of chronic obstructive pulmonary disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       obstructive pulmonary disease; (6) a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease, comprising the compound, a marker gene or an antiseanse nucleic acid corresponding to, a portion of the marker gene, a ribozyme, a polynucleotide that suppresses the expression of the gene through an RNAi effect or an antibody recognising a protein encoded by a marker gene; and (7) a DNA chip for testing for bronchial asthma or a chronic obstructive pulmonary disease, on which and antiasthmatic activities, and can be used in gene therapy. The method is useful for testing for or screening for a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease. The present sequence is used in the exemplification of the present invention.
                                                                 Example 11; SEQ ID NO 665; 241pp; English.

The present invention relates to PRO proteins and their coding sequences. The PRO proteins are useful for diagnosing and treating a B cell related disorder, e.g. x-linked infantile hypogammaglobulinemia, polysaccharide antigen unresponsiveness, selective IgA deficiency, selective IgA deficiency, selective IgA deficiency of IgG subclasses, immunodeficiency with hyper IgM, transient hypogammaglobulinemia of infancy, Burkitt's lymphoma, intermediate lymphoma, follicular lymphoma, type II hypersensitivity, rheumatoid arthritis, autoimmune mediated haemolytic ansemia, mysathenia gravis, hypoatenocorticism, glomerulonephritis, or anklylosing spondylitis. The PRO proteins are also useful for preparing a medicament for treating a condition that is responsive to the PRO mon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New PRO polypeptide, useful for diagnosing and treating a B cell related disorder, e.g. Burkitt's lymphoma, rheumatoid arthritis, autoimmune mediated hemolytic anemia, myasthenia gravis or ankylosing spondylitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            20 RAAPRVLFGEWILGEISSGCYEGLOWLDEARTCFRVPWKHFARKDLSEADARIFKAWAVA 79

The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WI.

New PRO polypeptides and polynucleotides, useful for treating e.g. erythematosus, rheumatoid arthritis, diabetes mellitus, immune-mediated renal disease, or demyelinating diseases of the central or peripheral nervous system

Claim 7; SEQ ID NO 1276; 2940pp; English

The invention relates to a novel isolated nucleic acid and the PRO polypoptide encoded by it. A protein of the invention has antiinflammatory, antiarthritic, antirheumatic, immunosuppressive, osceopathic, antidiabetic, dermatological, antipsoriatic, antiallergic, antiasthmatic, antidiabetic, dermatological, antipsoriatic, antiallergic, antiasthmatic, nepatotropic, and respiratory activity. A polymelectide of the invention may have a use in gene therapy. The PRO polypeptide, contagonist, or antibody that specifically binds to the agonist, antagonist, or antibody that specifically binds to the polypeptide is useful for treating an immune related disorder such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, invenile chronic arthritis, a spondyloarthropathy, systemic solerosis, an idiopathic inflammatory myopathy, Sjogren's syndrome, systemic thrombocycopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, a demyelinating disease of the central or peripheral nervous system, idiopathic demyelinating polyneuropathy, dullain-Barre syndrome, a chronic inflammatory demyelinating polyneuropathy, a heptobiliary chilarinic disease, infectious or autoimmune chronic active hepticials. biliary cirrhosis, granulomatous hepatitis, sclerosing cholangitis, inflammatory bowel disease, gluten-sensitive enteropathy, Whipple's disease, an autoimmune or immune-mediated skin disease, a bullous skin disease, erythema multiforme, contact dermatitis, psoriasis, an allergic disease, asthma, allergic rhinitis, atopic dermatitis, food hypersensitivity, urticaria, an immunologic disease of the lung, ecsinophilic pneumonia, idiopathic pulmonary fibrosis, hypersensitivity pneumonitis, a transplantation associated disease, graft rejection or graft-versus-host disease. The present sequence represents a PRO protein of the invention

Testing for bronchial asthma or chronic obstructive pulmonary disease by comparing the expression level of a marker gene in a biological sample from a subject with the expression level of the gene in a sample from a healthy subject.

Example 11; SEQ ID NO 663; 241pp; English.

The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises determining the expression level of a marker gene in a biological sample from a subject, comparing the expression level determined with the expression level be marker gene in a biological sample from a subject, comparing the expression level a bronchial asthma or chronic expression levels increase when respiratory epithelial constructive pulmonary disease. The marker gene comprises: (a) a group of genes (S1) whose expression levels increase when respiratory epithelial cells are stimulated with interleukin-13; or (b) a group of genes (S2) constructive pulmonary disease; (C) a kit for screening for bronchial asthma or chronic obstructive pulmonary disease; (C) a kit for screening for a candidate compound for a therapeutic agent to treat bronchial asthma or chronic obstructive pulmonary disease; (C) an animal model for bronchial asthma or chronic obstructive pulmonary disease; (C) a therapeutic agent for bronchial constructive pulmonary disease; (C) a therapeutic agent for bronchial constructive pulmonary disease; (C) a therapeutic agent for bronchial constructive pulmonary disease; (C) a therapeutic agent for bronchial constructive pulmonary disease; (C) a portion of the gene through an RNAi effect or an antibody recognising the expression of the gene through an RNAi effect or an antibody recognising constructive muchial asthma or a chronic obstructive pulmonary disease, (C) a probe has been immobilised to assay a marker gene. (I) has respiratory for probe the septivities, and can be used in gene through an experience of the marker gene. (I) has respiratory for and antiasthmatic activities, and can be used in gene through an experience of the marker gene. (I) and the probable of the marker gene. (I) and constitution of the and antiasthmatic activities, and can be used in gene therapy. The method is useful for testing for or screening for a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease. The present sequence is used in the exemplification of the present invention.

The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises or chronic obstructive pulmonary disease. The method comprises correlating the expression level of a marker gene in a biological sample from a subject, comparing the expression level determined with the expression level be marker gene comprises (a) a group of carboric and judging whether the subject has bronchial athma or chronic obstructive pulmonary disease. The marker gene comprises: (a) a group of genes (51) whose expression levels increase when respiratory epithelial cells are stimulated with interleukin-13; or (b) a group of genes (52) whose expression levels decrease when respiratory epithelial cells are stimulated with interleukin-13; or (b) a group of genes (52) whose expression levels decrease when respiratory epithelial are stimulated with interleukin-13. Also described: (l) a reagent (l) for certaing for bronchial asthma or chronic obstructive pulmonary disease; (2) a kit for screening for a candidate compound for a therapeutic agent to treat bronchial asthma or chronic obstructive pulmonary disease; (4) an inducer that induces bronchial asthma in a mounes; (5) a marker gene or an annial model for bronchial asthma in a moune; (5) a sethma or chronic obstructive pulmonary disease, comprising the compound, a marker gene, an intisense mucleic acid corresponding to a portion of the marker gene or an antisense mucleic acid corresponding to a portion of the marker gene, a riboxyme, a polymucleotide that suppresses the expression of the gene through an RNAi effect or an antibody recognising conchial asthma or a chronic obstructive pulmonary disease, on which a probe has been immobilised to assay a marker gene. (1) has respiratory and antiasthmatic activities, and can be used in gene therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease. The present conchial asthma or chronic obstructive pulmonary disease. The present conchial asthma or chronic obs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 KAWAVARGRWPPSSRGGGPPPEAETAERAGWKTNFRCALRSTRRFVMLRDNSGDPADPHK 120

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human cliagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnost e g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp inflammatory disorders, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F; Harthshorne TA, Suchorolski MT, Altus CM, Pitts SJ, Elder LV; Mooney EM, Delegeane AM, Panesar IS, Banville SC, Reddy TP; Stevens KA, Blanchard JL, Panzer SR, Wang X, Au AP, Gerstin EH; Peralta CH, Anderson SB, Rioux P, Shen EJ, Wu MC, Stuve LL; Lagace RE, Spiro PA, Stewart EA, Wingrove J, Vitt UA, Kirton ES; Xu Y, Kwong M, Policky JL, Hurwitz BL, Ma Y, Jackson JL, Gietzen D; Patury S, Shi X, Suarez CJ;
New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnostic a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or in gene mapping.
                                                                                                                                                                                                                                                                                                                                                          gene therapy; human diagnostic and therapeutic polynucleotide; dithp.

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A puricleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine cutoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the cinvention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                     New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosting a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or in gene mapping.
                                                                                                                                                                                                                                             Claim 27; Page; 190pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 US-09-349-016-8970

Sequence 8970, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

CURRENT FILING DATE: 2000-04-14

PRIOR APPLICATION NUMBER: 60/231,768

PRIOR PLILING DATE: 2000-10-03

PRIOR APPLICATION NUMBER: 60/231,498

PRIOR FILING DATE: 2000-00-08

PRIOR FILING DATE: 2000-00-08

NUMBER OF SEQ ID NOS: 207012

SEQ ID NOS: 207012

A,Title: An interferon regulatory factor-related gene (xIRF-6) is expressed in the poster A,Reference number: JC6520; MUID:98086218; PMID:9426249
A,Contents: Embryo
A,Accession: JC6520
A,Molecule type: mRNA
A,Residues: 1-459 <-MAT>
A,Content: This protein plays a role in the transcriptional regulation of specific genes C,Goment: This protein plays a role in the transcriptional regulation of specific genes A,Genetics: xIRF-6
C,Superfamily: lymphoid-specific interferon regulatory factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tymphoid-specific interferon regulatory factor - mouse

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                        ò
A;Description: Molecular cloning of LSIRF, a lymphoid-specific member of the interferon A;Reference number: S57838
A;Accession: S57838
A;Accession: S57838
A;Status: preliminary
A;Molecule type: mRNA
A;Residues: 1-450
A;Reference: EMBL: 11692; NID:g790199; PIDN:AAA75309.1; PID:g790200
B;Eisenbeis, C.F.; Singh, H.; Storb, U.
A;Ritle: Pip, a novel IRF family member, is a lymphoid-specific, PU.1-dependent transcrift A;Reference number: 149359; MUID:95317607; PMID:7797077
A;Accession: 149359
A;Status: translated from GB/EMBL/DDBJ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A;Residues: 1-424 <DRI>
